

DO we really need more spectrum pollution? I already have birdies up and down the Amateur bands from devices that supposedly meet part 15 requirements and now I'm suppose to happily accept broadband hash just so corporations can make a profit? An Article in Conformity magazine by a testing house stated that when they tested a number of devices that were certified to meet Part 15, many didn't. Are you just going to believe it when BPL providers say they meet Part 15, or are you really going to test to see if they do?? If they don't, are you going to cite them?? Personally, I don't think you will do anything. Too much money is at stake, but I can hope you'll do the right thing.
